## EM35x NCP Host (STM32) Module Technical Specification

When combined with an EM35x NCP Breakout Board, the Ember® STM32 NCP Host Module offers a complete ZigBee wireless solution for development and deployment of a low-data-rate, low-power ZigBee application. The STM32 microprocessor is part of the two-layer (FR4-based) host module that connects to the EM35x NCP Breakout Board through the board-to-board connectors.

This document provides the technical specification for the STM32 EM35x NCP Host Module. It describes the board-level interfaces as well as the key performance parameters. In addition, it provides the necessary information for developer to validate their application designs using the STM32 EM35x NCP Host Module.

#### Contents

STM32 Host Module Features	2

## STM32 Host Module Features

The STM32 EM35x NCP Host Module offers:

- Cortex-M3 based microprocessor (STM32F103RET6)
  - 512Kbytes FLASH, 64Kbytes RAM
- Host UART1 for use with STM32 serial bootloader and application serial UART
- Host UART2 for EZSP UART interface to EM35x NCP
- Host SPI1 for EZSP SPI interface to EM35x NCP
- 16 additional Host GPIO routed to mating connector for application use on EM35x NCP Breakout Board
- All unused Host GPIO routed to test points
- 14-pin, 0.1" pitch, dual-row, JTAG programming and debug header (could be used with a JTAG programmer such as SEGGER's JLINK.)
- 16-pin, 0.1" pitch, single-row along with a 20-pin 0.1" pitch, single-row, board-to-board connector for mating to the EM35x NCP Breakout Board
- Spare Host IO routed to test points for application use

Table 1 lists the DC electrical characteristics of the STM32 EM35x NCP Host Module.

Table 1. DC electrical characteristics

Parameter	Min.	Тур.	Max.	Unit
VDD supply	2.0		3.6	V
Current Draw (active)		45		mA
Operating temperature	0		+ 55	С

For more information on the STM32F103RET6, refer to the STM32 datasheet (http://www.st.com/stonline/products/literature/ds/14611.pdf).

#### **Components**

Figure 1 illustrates the components on layer 1 (top side), while Figure 2 illustrates the components on layer 2 (bottom side).

Figure 1. Assembly print for layer 1

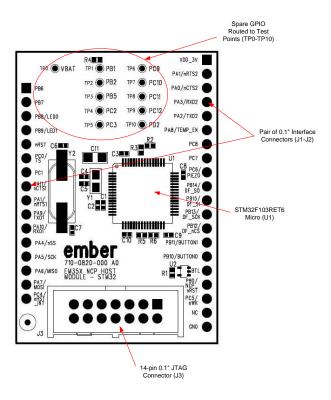

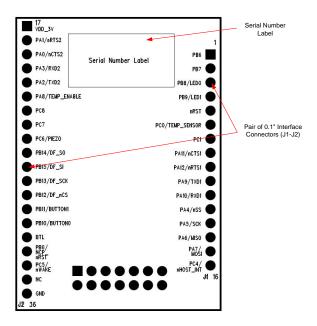

Figure 2. Assembly print for layer 2

#### **STM32 Microcontroller**

The STM32 NCP Host Module contains the STM32F103RET6 microcontroller from ST Microelectronics. This microcontroller is based on the Cortex-M3 core from ARM. This version of the STM32 contains 512Kbytes of FLASH and 64Kbytes of SRAM. 2 USARTs are exposed to the board-to-board connector for STM32 system bootloading (STM32 USART1) and EZSP UART (STM32 USART2) to the EM35x NCP. 2 SPI ports are also routed to the board-to-board connector for EZSP SPI interface to the EM35x NCP (STM32 SPI1) and external DataFlash (STM32 SPI2). Various other IOs are exposed to the board-to-board connector, including timers and interrupts. For more information on the STM32F103RET6, refer to the STM32 datasheet

(<a href="http://www.st.com/stonline/products/literature/ds/14611.pdf">http://www.st.com/stonline/products/literature/ds/14611.pdf</a>).

#### EM35x NCP Breakout Board interface connector (J1-J2)

Two single-row, 0.1" pitch, connectors make up the STM32 NCP host module interface to the EM35x NCP Breakout Board. The board-to-board connector scheme allows access to 16 Host GPIO for application purposes, along with 2 USART ports and 1 SPI port dedicated to EZSP and debug use. These 16 Host GPIO are listed in Table 2; the connector is illustrated in Figure 3. Interface connector dimensions are shown in Figure 4

Table 2. Host GPIO Functions

Host GPIO	STM32 I/O	Primary GPIO Function
HGPIO0	PB8	Application LED (LED0)
HGPIO1	PB9	Application LED (LED1)
HGPIO2	PB10	Application Button (BUTTON0)
HGPIO3	PB11	Application Button (BUTTON1)
HGPIO4	PC6	Application Speaker (PIEZO)

<sup>&</sup>lt;sup>2</sup> with respect to the STM32

#### JTAG Programming and Debug Connector (J3)

The STM32 NCP Host module includes a 14-pin 0.1" dual-row header for JTAG programming and debug access. Figure 5 shows the pinout of this header. Note that the EM35x NCP Kit does not ship with a programmer that interfaces to this header. Third-party programmers may connect to this header. For example, the J-Link ARM 14-pin Adapter from SEGGER (<a href="http://www.segger.com/cms/jlink-adapters.html#14pinAdapter">http://www.segger.com/cms/jlink-adapters.html#14pinAdapter</a>) may be connected directly to this header.

Figure 5. JTAG Connector Pinout (J3)

#### Unused STM32 GPIO (TP0-TP10)

The STM32 NCP Host module routes all GPIO not routed to the mating connectors to test points TPO through TP10. This allows the developer to utilize all STM32 GPIO for their application, if required. Table 4 lists these test points.

Table 4, STM32 Unused GPIO Routed to Test Points

Test Point	Signal name	Test Point	Signal name
TP0	VBAT	TP6	PC9
TP1	PB1	TP7	PC10
TP2	PB2_BOOT1	TP8	PC11
TP3	PB5	TP9	PC12
TP4	PC2	TP10	PD2
TP5	PC3		

#### STM32 NCP Host Module Schematic

The STM32 NCP Host Module schematic is included at the end of this document.

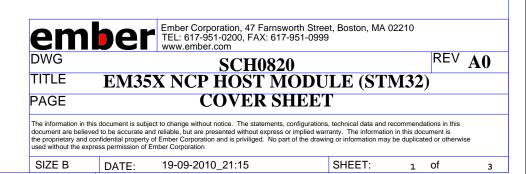

### After Reading This Document

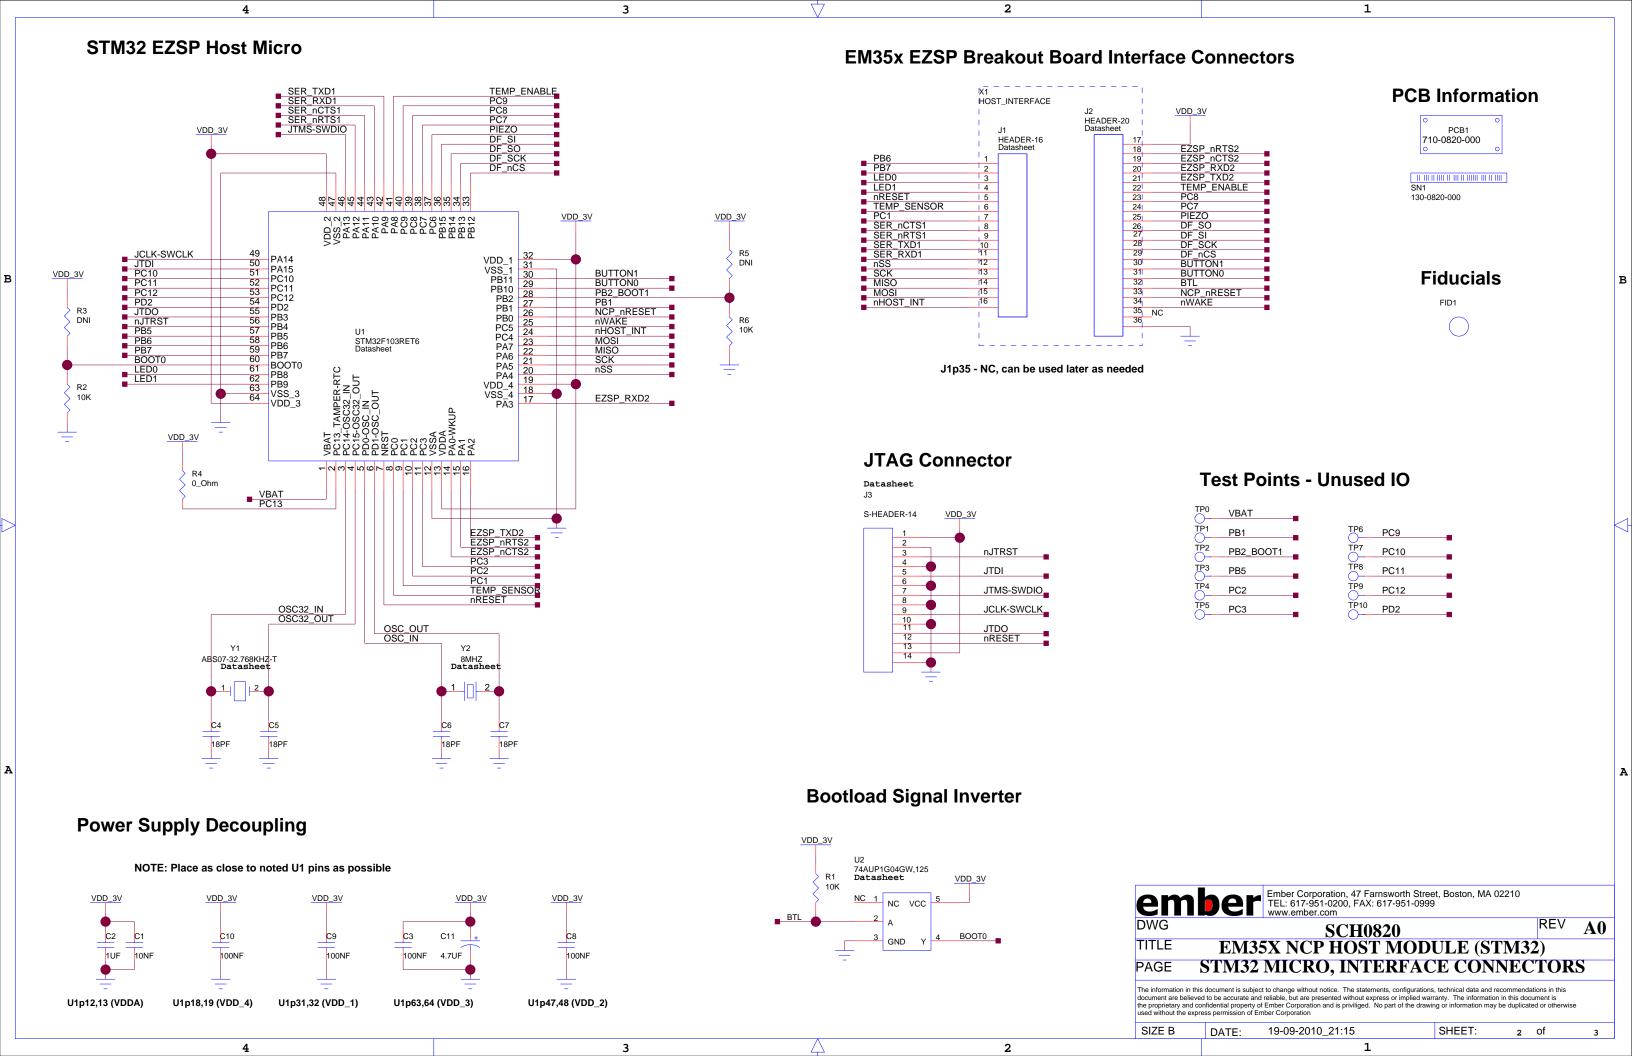

If you have questions or require assistance with the procedures described in this document, contact Ember Customer Support. The Ember Customer Support portal provides a wide array of hardware and software documentation such as FAQ's, reference designs, user guides, application notes, and the latest software available to download. To obtain support on all Ember products and to gain access to the Ember Customer Support portal, visit <a href="http://www.ember.com/support\_index.html">http://www.ember.com/support\_index.html</a>.

# EM35x NCP Host Module (STM32)

Sheet	Details
1	COVER SHEET
2	STM32 MICRO, INTERFACE CONNECTORS
3	REVISION NOTES

#### SCHEMATIC NOTES:

-- Version P0 --\*Released: 2010-06-11

\*Initial version released, Version PO (initial draft)

-- Version P1 --\*Released: 2010-08-03 \*Changes from P0 to P1:

1) Swapped UART1 with UART2 on X1 (J1, J2).

2) Changed R2 from 0 ohm to 10k ohm.

3) Changed R6 from DNI to 10k ohm.

Changed U1.27 net connection from BTL to PB1.

5) Change TP1 to TP0 for VBAT net.

6) Added TP1 for PB1 net.

7) Added inverter IC U2 for inverting BTL net for connection to BOOTO net.

-- Version A0 --\*Released: 2010-09-20

\*Production version release

\*Changes from P1 to A0:

Removed DS1 and R1 for lowest current capability.
 Renamed UART1 nets to SER\_TXD1, etc.

3) Renamed UART2 nets to EZSP\_TXD1, etc.
4) Added 10k pull-up R7 to U2 BTL net.

5) Updated title from EZSP to NCP.

6) Corrected DF SO/ SI error at X1 J2p26/27 (reversed).

7) Removed InSight Port connector footprint J4.

8) Replaced J3 with 14-pin 0.1" JTAG connector.

#### PCB LAYOUT NOTES:

-- Version P0 --

\*Released: 2010-06-11

\*Initial version released, Version P0 (initial draft)

-- Version P1 --

\*Released: 2010-08-03

\*Changes from P0 to P1: 1) Added Inverter IC U2.

2) Re-routed UART1 and UART2 nets.

3) Added missing test points from PO version.

-- Version A0 --

\*Released: 2010-09-20

\*Changes from P1 to A0:

\*Production version release 1) All schematic notes reflected in layout.
